Alert Detail

Medium	Content Security Policy (CSP) Header Not Set
Description	Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks. These attacks are used for everything from data theft to site defacement or distribution of malware. CSP provides a set of standard HTTP headers that allow website owners to declare approved sources of content that browsers should be allowed to load on that page — covered types are JavaScript, CSS, HTML frames, fonts, images and embeddable objects such as Java applets, ActiveX, audio and video files.

Instances		Systemic
Solution		Ensure that your web server, application server, load balancer, etc. is configured to set the Content-Security-Policy header.
		https://developer.mozilla.org/en-US/docs/Web/HTTP/Guides/CSP

CWE Id	693
WASC Id	15
Plugin Id	10038

Medium	Cross-Domain Misconfiguration
Description	Web browser data loading may be possible, due to a Cross Origin Resource Sharing (CORS) misconfiguration on the web server.
URL	https://cdn.jsdelivr.net/npm/canvas-confetti@1.5.1/dist/confetti.browser.min.js
Node Name	https://cdn.jsdelivr.net/npm/canvas-confetti@1.5.1/dist/confetti.browser.min.js
Method	GET
Attack	
Evidence	Access-Control-Allow-Origin: *
Other Info	The CORS misconfiguration on the web server permits cross-domain read requests from arbitrary third party domains, using unauthenticated APIs on this domain. Web browser implementations do not permit arbitrary third parties to read the response from authenticated APIs, however. This reduces the risk somewhat. This misconfiguration could be used by an attacker to access data that is available in an unauthenticated manner, but which uses some other form of security, such as IP address white-listing.
URL	https://www.gstatic.com/recaptcha/releases/PoyoqOPhxBO7pBk68S4YbpHZ/recaptcha__en.js
Node Name	https://www.gstatic.com/recaptcha/releases/PoyoqOPhxBO7pBk68S4YbpHZ/recaptcha__en.js
Method	GET
Attack	
Evidence	Access-Control-Allow-Origin: *
Other Info	The CORS misconfiguration on the web server permits cross-domain read requests from arbitrary third party domains, using unauthenticated APIs on this domain. Web browser implementations do not permit arbitrary third parties to read the response from authenticated APIs, however. This reduces the risk somewhat. This misconfiguration could be used by an attacker to access data that is available in an unauthenticated manner, but which uses some other form of security, such as IP address white-listing.
Instances	2
Solution	Ensure that sensitive data is not available in an unauthenticated manner (using IP address white-listing, for instance). Configure the "Access-Control-Allow-Origin" HTTP header to a more restrictive set of domains, or remove all CORS headers entirely, to allow the web browser to enforce the Same Origin Policy (SOP) in a more restrictive manner.

CWE Id	264
WASC Id	14
Plugin Id	10098

Medium	HTTP to HTTPS Insecure Transition in Form Post

Description	This check looks for insecure HTTP pages that host HTTPS forms. The issue is that an insecure HTTP page can easily be hijacked through MITM and the secure HTTPS form can be replaced or spoofed.
URL	http://amarsolution.com/login
Node Name	http://amarsolution.com/login
Method	GET
Attack	
Evidence	https://amarsolution.com/login
Other Info	The response to the following request over HTTP included an HTTPS form tag action attribute value: http://amarsolution.com/login The context was: <form class="login-form" action="https://amarsolution.com/login" method="POST"> <input type="hidden" name=" _token" value="EW4u1SQRc79OANnILD9e5owxwTAChCsL3GBCHGDU"> <div class=" input-grp"> <label for="user-id">Email or Username</label> <input name="email" value="" class="input-text " placeholder="Username or Email" required="required" autofocus id=" user-id"> </div> <div class="input-grp" style="position: relative;"> <label for="password" >Password</label> <input type="password" name="password" class="input-text" placeholder="Password" required="required" autocomplete="current-password" id=" password"> <i style="position: absolute;right: 20px;top: 40%;" class="fa fa-fw fa-eye toggle-password field-icon"></i> </div> <div class="d-flex justify-content-between align-items-center"> <label for="remember"> <input class="form-check-input" type="checkbox" value=" 1" type="checkbox" id="remember">Remember Me </label> </div> <button type="submit" class="ams-btn primary-btn my-3">Log in</button> </form>
Instances	1
Solution	Use HTTPS for landing pages that host secure forms.

Instances		Systemic
Solution		Modern Web browsers support the Content-Security-Policy and X-Frame-Options HTTP headers. Ensure one of them is set on all web pages returned by your site/app. If you expect the page to be framed only by pages on your server (e.g. it's part of a FRAMESET) then you'll want to use SAMEORIGIN, otherwise if you never expect the page to be framed, you should use DENY. Alternatively consider implementing Content Security Policy's "frame-ancestors" directive.

Low	Strict-Transport-Security Header Not Set
Description	HTTP Strict Transport Security (HSTS) is a web security policy mechanism whereby a web server declares that complying user agents (such as a web browser) are to interact with it using only secure HTTPS connections (i.e. HTTP layered over TLS/SSL). HSTS is an IETF standards track protocol and is specified in RFC 6797.

Low	X-Content-Type-Options Header Missing
Description	The Anti-MIME-Sniffing header X-Content-Type-Options was not set to 'nosniff'. This allows older versions of Internet Explorer and Chrome to perform MIME-sniffing on the response body, potentially causing the response body to be interpreted and displayed as a content type other than the declared content type. Current (early 2014) and legacy versions of Firefox will use the declared content type (if one is set), rather than performing MIME-sniffing.
URL	http://amarsolution.com/login
Node Name	http://amarsolution.com/login
Method	GET
Attack	
Evidence	
Other Info	This issue still applies to error type pages (401, 403, 500, etc.) as those pages are often still affected by injection issues, in which case there is still concern for browsers sniffing pages away from their actual content type. At "High" threshold this scan rule will not alert on client or server error responses.

At "High" threshold this scan rule will not alert on client or server error responses.
Instances	Systemic
Solution	Ensure that the application/web server sets the Content-Type header appropriately, and that it sets the X-Content-Type-Options header to 'nosniff' for all web pages. If possible, ensure that the end user uses a standards-compliant and modern web browser that does not perform MIME-sniffing at all, or that can be directed by the web application /web server to not perform MIME-sniffing.

Solution		For secure content, ensure the cache-control HTTP header is set with "no-cache, no-store, must-revalidate". If an asset should be cached consider setting the directives "public, max-age, immutable".
Reference		https://cheatsheetseries.owasp.org/cheatsheets/Session_Management_Cheat_Sheet.html#web-content-caching https://developer.mozilla.org/en-US/docs/Web/HTTP/Reference/Headers/Cache-Control https://grayduck.mn/2021/09/13/cache-control-recommendations/
CWE Id		525
WASC Id		13
Plugin Id		10015

Informational	Retrieved from Cache
Description	The content was retrieved from a shared cache. If the response data is sensitive, personal or user-specific, this may result in sensitive information being leaked. In some cases, this may even result in a user gaining complete control of the session of another user, depending on the configuration of the caching components in use in their environment. This is primarily an issue where caching servers such as "proxy" caches are configured on the local network. This configuration is typically found in corporate or educational environments, for instance.

	Other Info	The presence of the 'Age' header indicates that a HTTP/1.1 compliant caching server is in use.
Instances		5
Solution		Validate that the response does not contain sensitive, personal or user-specific information. If it does, consider the use of the following HTTP response headers, to limit, or prevent the content being stored and retrieved from the cache by another user: Cache-Control: no-cache, no-store, must-revalidate, private Pragma: no-cache Expires: 0 This configuration directs both HTTP 1.0 and HTTP 1.1 compliant caching servers to not store the response, and to not retrieve the response (without validation) from the cache, in response to a similar request.

WASC Id	
Plugin Id	10112

Informational	User Agent Fuzzer
Description	Check for differences in response based on fuzzed User Agent (eg. mobile sites, access as a Search Engine Crawler). Compares the response statuscode and the hashcode of the response body with the original response.
